PROFESSIONAL SUMMARY

Bachelor's degree in Computer Science and Technology. **Nearly 15 years** of full-stack delivery experience. Recently **centered on Python and React as dual primary tracks**: Python for Web/APIs, automation, AI/data-side services, and tooling; React for admin consoles, dashboards, and marketing or product sites. Strong Java (Spring) and Node.js engineering as well. Comfortable owning the full lifecycle from requirements and architecture through coding, deployment, and operations. Representative domains: government big data, supply chain, international education SaaS, and LLM-powered applications.

Python & backend: Web/APIs (e.g. Flask), integration with Dify, N8n, LLMs, and data pipelines; ML and image/NLP-style projects in production; scripting and ops automation. Java (Spring Boot / Spring Cloud), Node.js; MySQL (SQL tuning, transactions, locks, sharding), Redis, ElasticSearch, ClickHouse; Kafka / RocketMQ / RabbitMQ; distributed transactions; ShardingSphere read/write split and sharding.

React & frontend: SPAs and admin systems (React, TypeScript, Ant Design, etc.), integration with REST APIs and automation workflows; Vue, Element Plus, Tailwind, etc.; Electron desktop apps.

Platform & engineering: Linux, Docker, Kubernetes; GitLab + Docker + Jenkins style CI/CD; typical middleware and stacks (JDK, MySQL, Redis, ES, Nexus, MinIO, etc.).

Data & performance: Hadoop / HBase / Hive in real projects; Gatling performance testing.

AI & intelligence: Private Dify and N8n deployment and workflow design; Ollama and on-prem LLMs; agents with MCP; classical ML/NLP (e.g. classification, tokenization, model training). **1+ years of vibe coding**—pairing with AI (Cursor, Copilot, etc.) for rapid prototyping and refactors, with human review for maintainability.

Collaboration & language: **Fluent professional English**, including fully English remote work with teams in Singapore; **independently delivered from zero to production** the brand site [Champ Code Academy](#) (Python + React stack). English self-introduction video: upper right on <https://chengqun2.github.io/>

Open-source samples (personal learning / demos): [Node on Linux](#), [TypeScript / blockchain demo](#), [Python Flask](#), [Kubernetes example](#), [React + Node](#); GitHub: <https://github.com/chengqun2>

WORK EXPERIENCE

Jiangsu Fangruan Technology Co., Ltd.

2023/6 — Present

Full Stack Developer

50–150 employees · Private

End-to-end AI products and internal systems: Dify, N8n, Ollama (DeepSeek-R1-class), ClickHouse, ElasticSearch, MySQL, Nginx, Docker.

Led by **React** and **Python** for admin UIs and intelligent services, with Vue, Java/Spring, Node/TS, Electron; N8n for LLM workflows.

Shanghai Wayz Intelligence Information Technology Co., Ltd.

Full Stack Developer

150–500 employees · Private

2022/7 — 2023/5 (10 mo)

Singapore edtech, **English remote**. **Sole owner** of **Champ Code Academy** (React + Python).

CRM, Chargebee/Stripe, automation (Airtable/Make/n8n), Supabase, Jira.

Nanjing Weishu Software Co., Ltd.

2017/12 — 2022/7 (4y7m)

Full Stack Developer

Listed · 150–500 employees

R&D: municipal **OA**, **vehicle big data**, **command**, **perception** systems; Java backend, design, core modules.

Spring Cloud/Boot, Kafka, Hadoop/HBase, Solr.

Yancheng Youyin Information Technology Co., Ltd.

Full Stack Developer

50–150 employees · Private

2015/7 — 2017/12 (2y5m)

Requirements, architecture, database, APIs, **project management**.

Jiangsu Huasheng Hengye Technology Co., Ltd.

Full Stack Developer

500–1000 employees · Private

2011/9 — 2015/7 (3y10m)

Java B/S development; talent portal, ERP, State Grid OA, WeChat backend.

PROJECT EXPERIENCE

AI Large Model Application

2024/8–Present

Enterprise LLM applications: React for conversational and configuration UIs; Python to orchestrate business logic and call Dify and other HTTP APIs. N8n for workflow automation, MySQL, Dify deployment, and on-prem DeepSeek-R1-class models. RAG knowledge base: document chunking, embedding vectorization, semantic retrieval and reranking for retrieval-augmented generation (RAG) Q&A. Dify for chat flows, published apps, and exposed APIs; Python integrates with Dify; React handles UI and state. N8n connects internal and external systems; agents extended with MCP where needed.

React Personal Website

2024/6–2024/7

React Personal Website Tech Stack: React, React-Router, React-Snap for Static-Export, and GitHub Pages.
GitHub Address:
<https://github.com/chengqun2/resume>
Online Access Address:
<https://chengqun2.github.io/resume/>

Node.js Backend Development

2024/4–2024/5

Node.js Backend Development Tech Stack: Node.js, Express, mysql2, sequelize, pkg packaging and publishing. Using Node.js to provide RESTful API interfaces, including scheduled tasks, MySQL CRUD operations, server status queries, web scraping, and other interfaces.

Electron Desktop Application Development

2024/2–2024/3

Electron Desktop Application Development Tech Stack: Electron, Node.js, HTML, CSS, axios API calls, electron-packager packaging Using Electron to develop desktop applications, mainly including background application main interface, message pop-ups, notification settings, application locking, etc.

Yancheng Sensing Big Data

2023/6–Present

AI Face Recognition (Python)

2023/6–2023/12

Yancheng Public Security Perception
Big Data Responsible for coding the
PC-web backend management
system (Vue3, element-plus);
Responsible for writing the Web
backend interface (SpringCloud,
Springboot); Main technical
responsibilities: SpringCloud,
SpringBoot, Oracle, Redis, Kafka,
ElasticSearch, front-end Vue The
project mainly captures portraits and
vehicle data at all monitoring points in
Yancheng City Kafka consumes 20
million data daily, Redis displays real-
time traffic rankings of each
checkpoint, data is stored in
ElasticSearch for personnel trajectory
queries MySQL (ShardingSphere-JDBC
table sharding)

AI Face Recognition The project was
developed using Python. The main
purpose of the project is to identify
captured photos of personnel. The
core API comes from the open source
project
https://github.com/ageitgey/face_recognition
The main principle is: 1). First convert
the photo to grayscale 2). Then divide
into 16px*16px blocks, with eyes and
mouth as center points 3). Then use
OpenFace to divide the face into 128
measurement values and store them 4).
Compare newly captured images with
database images, the closest match is
the identified result.

AI-Machine Learning

2023/12-2024/1

Yancheng Public Security Police Case
Automatic Classification System
Responsible for PC-web page code
development (Vue3, element-plus);
Responsible for Web backend
interface development (Springboot);
Main technical responsibilities:
SpringBoot, MySQL, front-end Vue The
project mainly uses Naive Bayes
algorithm and HanLP word segmenter
to train 2 million police case contents
and categories in the city, generating a
data model. This model is mainly used
for intelligent classification of newly
generated police cases

React-node-example

2023/10-2023/12

Responsible for the code writing of the
PC-web backend management
system (NodeJs + ReactJs); GitHub
address:
<https://github.com/chengqun2/react-node-example>
